

M-01 — AI Fundamentals

What is this about?

What AI actually is, in plain language — and what it changes on your desk on Monday morning.

The idea, in plain terms

Ramesh runs dispatch at the Bhiwandi warehouse. Every Friday he writes delay notes for the shipments that missed their date. He already knows every order number, every reason, every new date. What takes him two hours is finding the words. You hand over the facts. A clean draft comes back in a minute. Your time goes into checking it, not typing it.

Key things to know

- Give it facts, never files. Type the order number and the dates. Do not paste the contract.
- Check every number, name and date yourself before the text goes anywhere.
- Treat the output as your draft that you edited. Never present it as a source.
- Use the tool the company has approved: [COMPANY INPUT NEEDED: name of the approved AI assistant]. A personal login puts our text on someone else's account.

A simple example

Situation: A client in Sharjah emails: "Your team promised delivery on the 12th. Nothing has arrived. Explain." You have the tracking sheet open. Your manager is in a meeting until 11.

What to do: Type only the three facts you already know into the approved assistant and ask for a 100-word reply.

Remember

- **By default it predicts, it does not look up** — Built from patterns in text. Some tools search first — assume nothing was looked up unless shown otherwise.
- **Search finds pages, AI writes text** — Need something you can quote? Search. Need a draft, summary or rewrite? Assistant.
- **You bring the facts** — It has none of our order numbers, clients, policies or systems until you type them in.
- **Check every number and name** — A confident tone is not evidence. Verify before anything leaves your desk.
- **Facts, never files** — Type the order number. Never paste the contract, the salary sheet or the client list.
