

M-02 — Generative AI

What is this about?

What it actually makes, why every answer is different, and where it beats a search box.

The idea, in plain terms

Shalini runs marketing for a Pune plant. She asks an AI tool for a team note about a moved meeting. The note is excellent. It also mentions a quarterly bonus review that nobody has scheduled. Two people email HR about it. You will know why it does that, and how to catch it in four seconds.

Key things to know

- Text — emails, SOP drafts, replies to a complaint
- Structure — a messy list turned into a clean table
- Shorter versions — twelve pages into six bullets
- Options — ten subject lines, five ways to say no

A simple example

Situation: A customer in Abu Dhabi asks in writing what your standard warranty period is. You are fairly sure it is 12 months, but you have not actually checked.

What to do: Open the contract, confirm the period, then ask the tool to word the reply.

Remember

- **It builds, even when it also looked something up** — The wording is always constructed fresh — assume nothing was looked up unless the tool shows you it was.
- **Different every time** — Two colleagues asking the same thing get two answers. Neither is the record.
- **Gaps get filled, not flagged** — A missing fact produces a plausible invention, never a blank space.
- **Strong on shape, weak on truth** — Drafting, shortening, restructuring, options. Not lookups, not policy, not figures.
- **Read every line** — Anything you did not supply and cannot verify comes out before you send.

Inducto Learning & Knowledge — quick reference for M-02. Watch the lesson video for the full explanation; this page is a takeaway, not a replacement for it.
