

M-04 — AI Hallucinations & Fact-Checking

What is this about?

How to catch a confident wrong answer in under a minute, before it reaches a customer.

The idea, in plain terms

Kavita answers support tickets for a Bengaluru team. A customer disputes a charge. She asks an AI tool what the policy says, and it quotes clause 7.3. She pastes the clause into her reply. There is no clause 7.3. Four checks, under a minute, and this never leaves your desk.

Key things to know

- **QUOTES** — clause numbers, policy wording, what someone said
- **FIGURES** — rates, prices, percentages, penalties, totals
- **NAMES** — people, products, suppliers, systems, standards
- **REFERENCES** — circulars, sections, studies, page numbers

A simple example

Situation: A customer disputes a delivery charge and asks which term allows it. The AI answer quotes "clause 7.3" and reads like the contract. You have not opened the contract.

What to do: Open the contract, find the real clause, then reply.

Remember

- **A gap never stays a gap** — It completes the sentence with something likely, rather than leaving a blank.
- **Four risky types** — Quotes, figures, names and references. These are where inventions cluster.
- **Underline, trace, open, cut** — Mark the details, ask who supplied them, check the source, delete the rest.
- **Paste the document in** — Grounding it in real text is far safer than asking about text it cannot see.
- **Asking twice proves nothing** — Two generations can agree and both be wrong. Only the source settles it.
