

M-09 — Planning & Productivity With AI

What is this about?

Turning a long list of intentions into a week you can actually finish.

The idea, in plain terms

Arun runs production planning near Coimbatore. His to-do list has 47 items. Every Friday he adds six and closes four. He is working hard and falling behind, and he cannot see which of the 47 actually matter. Sort by what breaks if it slips. Then plan only three days ahead.

Key things to know

- Anything in NO CONSEQUENCE that is over a month old
- Anything you have rescheduled more than three times
- Anything somebody else could do adequately
- Anything you only kept because you felt guilty

A simple example

Situation: Forty-seven items on your list, six hours of actual working time today after meetings, and three people already waiting on you.

What to do: Sort by consequence first, then plan three days.

Remember

- **Sort by consequence** — What breaks if it slips. Urgency belongs to whoever shouted last.
- **Plan three days** — Friday is fiction on Monday. Re-plan midweek in five minutes.
- **Build in a buffer** — People are consistently optimistic about their own estimates — a buffer corrects for it.
- **Stuck means undefined** — Ask for the first five minutes and the information you are missing.
- **Keep a not-now list** — Moved, not deleted. It turns background guilt into a decision.

Inducto Learning & Knowledge — quick reference for M-09. Watch the lesson video for the full explanation; this page is a takeaway, not a replacement for it.
