

M-15 — Safe Use of AI at Work

What is this about?

Which tools are approved, which settings to switch off, and how to keep a trail you can actually explain.

The idea, in plain terms

Harish runs projects in Abu Dhabi. A client asks, during an audit, whether any of their drawings have been processed by AI tools. He genuinely does not know. Nor does anyone else, because nobody kept a record. Approved tools, the right settings, and a habit of noting what you used.

Key things to know

- You signed in with a personal email, not your work one
- There was no single sign-on screen or company logo
- The site offered a free trial or asked for a card
- You found it through a search result or a social post

A simple example

Situation: A client auditor asks whether their technical drawings have been processed by any AI tool. You used an assistant during the project, but not on the drawings.

What to do: Say what you used it for, on which tool, and what you did not upload.

Remember

- **Approval is more than an account** — The tool, the configuration and the use case all need to be approved too, not just the account.
- **Two settings worth finding** — Training on your data, and chat history. Turn both off where you can.
- **Settings are not permission** — They reduce reuse. The paste rules do not change.
- **AI is already in your tools** — Reply suggestions, rewrite buttons, meeting bots. Mostly nobody chose them.
- **Keep a one-line note** — What for, which tool, what data, who checked it, when.

Inducto Learning & Knowledge — quick reference for M-15. Watch the lesson video for the full explanation; this page is a takeaway, not a replacement for it.
